Efe Beydoğan CS202 Section: 1 **HW1** Report Question 1: (a) To show that $5n^3+4n^2+10$ is $O(n^4)$, we need to find two positive constants c and n_0 such that $0 \le 5n^3 + 4n^2 + 10 \le cn^4$ for all $n \ge n_0$. If c = 5 and n = 2, it can be seen that $0 \le n_0$ $5n^3 + 4n^2 + 10 \le 5n^4$ for all $n \ge 2$. (b) **Tracing of insertion sort:** Initial array: Copy 8, shift 24 to 2nd position and paste 8 into first position: Copy 51, insert 51 on top of itself: Copy 28, shift 51 into 4th position and insert 28 into 3rd position: Copy 20, shift 24, 28 and 51, insert 20 into its place:

Copy 29, shift 51, insert 29 into its place:

| Copy 21 | , shift 24, | 28, 29, 5 | 1, insert 2 | 1 into its | place: | | | | |
|--|-----------------------|-----------------|-----------------|----------------------|----------------------|----------------------|-----------------|-----------------|----------------------|

7th pass will be the last pass since the array is sorted.

Question 2:

Screenshot of the console for part (c):

```
Selection sort:
Number of key comparisons: 120
Number of data moves: 45
Array after sorting: 3, 5, 6, 7, 8, 9, 11, 12, 12, 14, 14, 17, 18, 19, 20, 21
mergesort:
Number of key comparisons: 46
Number of data moves: 128
Array after sorting: 3, 5, 6, 7, 8, 9, 11, 12, 12, 14, 14, 17, 18, 19, 20, 21
quicksort:
Number of key comparisons: 45
Number of data moves: 102
Array after sorting: 3, 5, 6, 7, 8, 9, 11, 12, 12, 14, 14, 17, 18, 19, 20, 21
radixsort:
Array after sorting: 3, 5, 6, 7, 8, 9, 11, 12, 12, 14, 14, 17, 18, 19, 20, 21
                         execution time : 0.232 s
Process returned 0 (0x0)
Press any key to continue.
```

Question 3:

Selection sort is an algorithm which has $O(n^2)$ time complexity and the results I've found support this. This can be seen by comparing the first and the last situations in the random array case for selection sort. For array size with 6000, the algorithm takes 38 ms to run and for size 30000, it takes 917 ms, so when the array size is multiplied by 5, the algorithm takes roughly 25 times longer. Merge sort is supposed to have O(nlogn) time complexity and the results that can be seen in my screenshots above show that merge sort running time varies in a way that shows it has O(nlogn) time, so my empirical results and the theoratical expectations match for this case. My results are consistent for quicksort, which is O(nlogn) and radix sort, which is O(n), as well. Any small changes or discrepancies between my empirical results and the theoretical ones could be caused by the hardware or the IDE I am using to test these algorithms.

When applied to randomly created arrays, the algorithms behaved in an expected way and yielded the most accurate results, supporting their theoretical run times. When used on ascending or descending arrays, selection sort maintained its $O(n^2)$ complexity and since merge sort also works with $O(n\log n)$ complexity under any circumstance, there weren't any visible changes in their running times. However, when quicksort was used on already sorted ascending or descending arrays, the running times were significantly higher due to the choice of pivot. Since the very first element of the array was chosen as pivot in any scenario, worst case behavior of quicksort was achieved, which made the quicksort algorithm complexity $O(n^2)$ for those cases instead of $O(n\log n)$, thus resulting in much higher running times than if the pivot was chosen in a better way. Radix sort also maintained its complexity for all three array types.
